

PsV nAb response by variant in Phase 1 studies

Units (IU50/ml) were defined by calibrating D614 ID50 titers to the 20/136 WHO International Standard, which amounted to multiplying original ID50 values by 0.242. ID50 to other strains were not calibrated to an international standard: the original ID50 values were multiplied by 0.242 also to maximize the comparability of readouts across strains.
